**Abstract:**

Background: This idea was thought up on the internet, where kissing the homies goodnight became a meme, and for some even a trend. People who took part in the trend via a survey were shown to actually have a decrease in harmful genetic material, allowing for certain chronic illnesses to appear less.

**Methods**

In this study we will see what effects kissing your male friends has on the human body and the way this effect happens, by dissecting genetic materials, performing surveys and testing very dangerous and unsafe chemicals in people who partook in this trend. We are not allowed to put these chemicals into people but we are doing it anyway in the name of science.

## Background

After the lips between male acquaintances touch, a chemical called “homofine” is released into the bloodstream. This chemical creates a cooling and drowsy effect in the patients we injected it into. This effect was consistent and appeared to be the same as the effects of melatonin and methamphetamine combined. This newfound hormone has the chemical composition of BaNa2R-AMA (Barium-DiNatrium-Arginine-Allyl Methacrylate) and is created by the BL gland (Boy Love gland) found beneath the left testis. Whenever stimulation to the lips, or the BL gland is exuded the gland creates and sends out homofine throughout the entire body.

Hence, why after kissing the homies goodnight the man immediately feels a sense of calm wash over his body, while feeling ecstatic. There are an additional 172 homofine receptors throughout the human body hiding as nerve cells, which give a cleansing effect to the surrounding areas. Most of these receptors are found around the crotch, brainstem and armpits.

As for the implications of this hormone, when it is exposed to sunlight its effect immediately dissipates and it turns into hydrogen-chloride and a rest gas which always has a different formula. Hence, extraction of this hormone is rarely done due to the damage it could deal to the person inhibiting the hormone. The effects also diminish sooner when not naturally made, and women are unable to make use of this hormone.

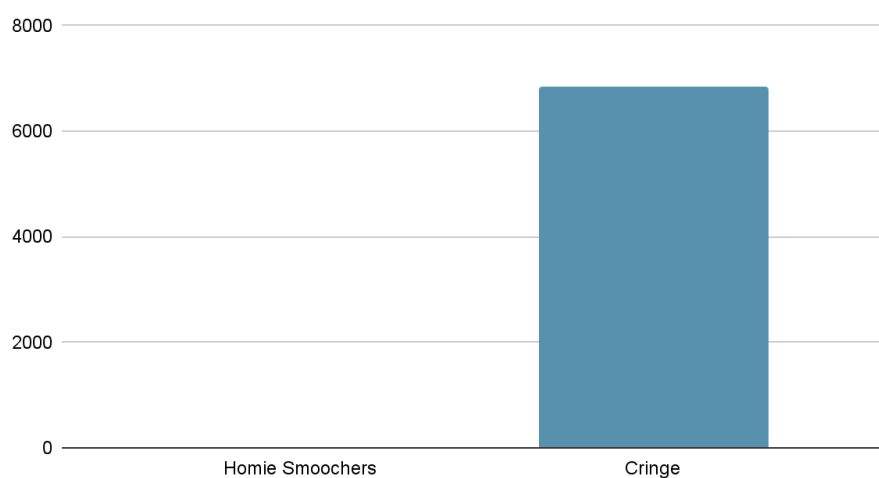

Whether or not this act is seen as homosexual is up to the individual, but due to its incredible medical benefits, such as decreasing the risk of alzheimer's disease by up to 57%, decreasing the risk of cancer by up to 72%, decreasing the risk of dementia by up to 43%, decreasing the risk of cardiovascular issues by 17%, decreasing the risk of diabetes by 94%, decreasing the risk of strokes ;) by -99%, and decreasing the risk of creating addictions by 73%.

These are only the recorded effects and additional effects could be quantified given enough time is invested in the further research of Homofine and its benefits.

## Method

We found out that kissing the homies goodnight has positive effects after creating and asking a plethora of questionnaires to 96 people who did and 17932 who did not kiss their homies goodnight, and we got the following results as a result of these questionnaires.

### Depression

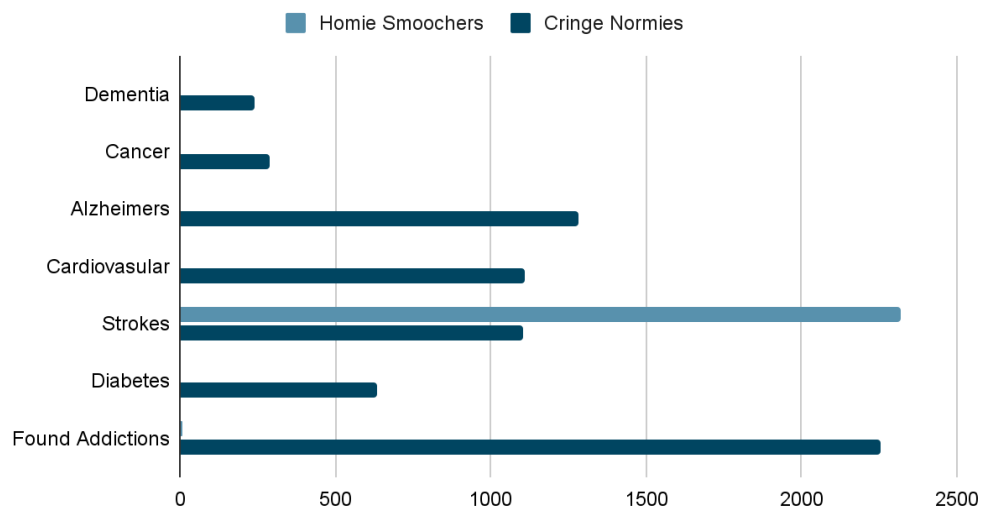

As can be seen from this graph, people who kiss their homies are never depressed, versus the cringe normies who do not smooch their homies.

All men were definitely given the exact same questionnaires based upon their initial answer to the question on if they kissed their homies goodnight. I promise.

Below this, we have the results from our extreme research based on genetic material after coming in contact with Homofine. This is all actual information we got from all participants' medical records, which for the record were willfully given and not forced out of them by threatening their families with pipe bombs within the mail.

### Points scored

As can be seen, these numbers are astonishingly different, and the cringe normies do seem to be especially exempt to chronic diseases.

Homie smoochers on the other hand appear to be incredibly safe against these types of effects, showing how Homofine is doing its work properly within the bros bodies. God I wish I was inside my bros like Homofine is.

These results were spliced from their DNA and were found within their medical records. Whenever spliced DNA did not line up with the medical record, we committed several crimes to add the data to the medical records. 7 people were arrested in this pursuit, of which 3 were executed after confessing to ulterior charges. Any DNA which seemed fine was immediately added to the list.

We calculated these numbers by dividing the number of normie participants by the amount of homie smoochers. We then calculated the difference and transferred those to percentages, giving our earlier numbers.

We got these statistics by surveying 17 elderly homes and 4 drug dens. As additional info, it was especially interesting to see that the places where people kissed their homies less, drug use was less prominent. The elderly homes had a higher total amount of drugs in their system than the people found in the drug dens, and the homofine levels found in the drug dens were up to 98% more prominent than the elderly homes. We also surveyed random foreign people on the street who we asked completely non-relevant questions after which we forged their data to increase the numbers on our graphs to make this research paper look like it has more data.

## Conclusion

Kissing the homies goodnight has an immense amount of mental and physical health benefits, on top of it reducing the drug usage and abuse among the drug dealers and users.

Hence, after superfluous and extensive research, we found out that not kissing the homies goodnight increases levels of stress, anxiety and social status. As such, the only plausible method of starting your sleep is to give your bro a big fat fucking smooch, on the lips.

## Competing Interests

The authors declare they have no competing interests.

## Consent for Publication

We lack every single right and consent for publication we could have probably gotten.

## Ethics Approval and Consent to participate

We have committed what would be considered war crimes in nearly all countries in the world, and have gotten no legal consent from anyone that joined. Ethically, we are the worst people ever.

## Availability of Data and Materials

There wasn't any data, and materials needed to be thieved.
